

Fluid Pressure: Center of Pressure
Pictures from Hibbeler Ch. 9

In these illustrations, Point C is the Centroid of the pressure distribution. The resultant force F_R of the pressure distribution passes through this point. This point is important; we use it to write moment equations for F_R about hinges and other points.

Point P is the point where line of action of F_R intersects the plate or surface. This is interesting from a theoretical standpoint, but we rarely use it or ask you to find it.
